```

Interpreting an error message:

- The location of the error is specified at the ***very top*** of the error message.
- The explanation of the error is given at the ***very bottom*** of the error message.
- The information in the middle of the error message can be useful, but usually has a lot of extraneous information. It's best to avoid reading through all of that stuff at first, and try to solve your error using what you know about the location of the error in your code and the explanation given at the very bottom of the message.
- A good strategy can be to copy the computer-worded explanation at the very bottom and paste it into a search engine to see how other people have solved that error before.

Your name	**What line of code gave you the error?** (paste the code itself, not the line number)	**What was the error in computer words?**	**What was the error in your own words?**	**How did you fix it?**
Example	`for t in np.linspace(0, 5, 0.1):`	TypeError: 'float' object cannot be interpreted as an integer	The third input to np.linspace is supposed to be an integer, which is the number of elements in the array.	I switched to np.arange instead, where the third input is the step size. This is what I meant to use originally, but got them mixed up.

Theon Abbott	`for i in range(0, len(vint)):`	**NameError**: name 'vint' is not defined	I was using vint earlier and changed to v0 but did not change this part so it was trying to call something that did not exist.	Changed vint to v0.

Jordan Miller	`def fib(arg):`
	
	`  fib_prev = 0`
	`  fib_curr = 1`
	
	`for i in range(2, arg + 1):`
	`  fib_next = fib_curr + fib_prev`
	`  fib_prev = fib_curr`
	`  fib_curr = fib_next`
	
	`if arg == 0:`
	`  fib_curr = 0`
	
	`print(zeroth, first, second, fourth, seventh, tenth)`
		NameError: name 'arg' is not defined	I did not indent my code at the “for … in …” or the “if”. This means the function could not use the data since it was not all together so to speak.	I indented the lines and ran it again to get it to work.

Heidi Thiele	`energy1(0.4, 10.7)`	name 'energy1' is not defined	The name energy1 was not defined anywhere	I changed this to the name of the function
Benjamin Johnson	`18 zeroth = fib_curr`	NameError: name 'fib_curr' is not defined	Fib_curr had not been assigned a value	I made it return fib_curr
Ian Wakeling	`def KE(mass,vel)`	SyntaxError: expected ‘:’	The define function is missing a colon	I added a colon to the define code
Aiden Harlow	`TKE += KE`	**UnboundLocalError**: cannot access local variable 'TKE' where it is not associated with a value	Scope Error. The function did not recognize TKE	Declare global TKE at top of the function
Vanax K	`def KE(mass,vel)`	SyntaxError: expected ':'	I forgot to end the line with a “:”.	Add the :

Moriah Rud	`Cell In[2], line 3`
	`  if n==0`
	`  ^`
	`SyntaxError: expected ':'`
		SyntaxError: Expected ‘:’	I didn’t place a colon after the “if” loop	I typed a colon

Nicolas Jacobson	`--> 112 print(fibb_curr)`	**NameError**: name 'fibb_curr' is not defined	I misspelled one of my variables!	I spelled it right!
Milo Muniz	 `print("Kinetic energy of this object is", KE, "joules")`	Name TError: name 'KE' is not defined	I forgot that I redefined my kinetic energy variable to energy	I changed KE to the correct variable "energy"
Alex Hernandez	`----> 2 energy = 0.5 * mass * vel ** 2`	NameError: name 'mass' is not defined		
Sam Whitmire	`forces return [n]`	**SyntaxError:** invalid syntax	I think i worded the command incorrectly	I removed the line since I didn't need it anyway.
Dean Garlitz	`7 KE= .5 * mass * vel ** 2`	`TypeError Traceback (most recent call last) Cell In[28], line 7 4 vel=[10.7,-4.9, -7.4,8.2] 6 for x in mass: ----> 7 KE= .5 * mass * vel ** 2 8 print(KE) 13 energy1 = KE` `TypeError: can't multiply sequence by non-int of type 'float' `	I cant do math with the lists they way i thought I could	Asked copilot, and got back a new too called zip that allowed me to do the math I wanted to do

Josh Litchfield	`def flight_time(g=9.81, v0, angle):`	**Cell In[15], line 3** **def flight_time(g=9.81, v0, angle): #inputs g, inititial velocity, and angle then returns the final time rounded to 2 sig figs** **^** **SyntaxError:** non-default argument follows default argument	The default input needs to be the last input in the function definition	I moved g=9.81 to after v0 and angle inputs

Gavin Hawk	`def flt(v0,angle):`
	`angle_rad = np.radians(angle)`
	`vx0 = v0 * np.cos(angle_rad)`
	`vy0 = v0 * np.sin(angle_rad)`
	`tf = 2 * vy0 / g`
	`t = np.linspace(0, tf, 500)`
	`x = vx0 * t`
	`y = vy0 * t - 0.5 * g * t ** 2`
	`info = str(v0) + " m/s, " + str(angle) + " deg"`
	`plt.plot(x, y, label=info)`
	`return: np.round(tf,2)`
		Cell In[138], line 19
		return: np.round(tf,2)
		^
		SyntaxError: invalid syntax
			Return is not meant to be separated by a colon as I did	I removed the colon and the function then worked as intended.

Adam Jabr	`forces_arr = [`
	`[0, 7, 83, -9, -70],`
	`[4, 5, -9],`
	`[3, 0, -4],`
	`[None]`
	`]`
		TypeError: unsupported operand type(s) for +: 'int' and 'NoneType'	[None] is not considered an integer, but [] is.	I replaced [None] with [].

Carly Otto	`'numpy.float64' object is not callable`	Cell **In[35], line 22** 19 flight_time = np.round(tf, 2)	I defined the function in the beginning of the code, but I didn't call the function. I instead typed	I replaced "flight_time" with "function" which is the function name. I was

		20 **return**(flight_time) **---> 22** flight_time1(20,30) 23 flight_time2(18,60) 24 flight_time3(18,45)	“flight_time(v0,angle)” instead of the function name(v0,angle) I defined earlier.	lazy and didn’t name it anything interesting.
Theo Cahall	`def Force([]):`	**Cell In[72], line 1** **def Force([]):** ^ **SyntaxError:** invalid syntax	I tried to make the input empty array instead of a blank variable.	Changed it to a blank variable (which couould
